

63 of the Guidelines 02/2025 says:

"Whichever approach to storage limitation is chosen, it must be effective. Where this would require the deletion of part of the blockchain, including the deletion of any copies held by nodes or other parties, controllers should ensure that sufficient technical and organisational measures are in place for doing so."

Feedback on this:

Breakthroughs in machine learning and data science rely on this access to large, diverse datasets. Strict deletion policies are against european interests. Innovation needs diverse Datasets. Strict policies and even possible deletion hamper innovation. (?!)

And automatically deleting data too aggressively is against fraud detection, if you ask me. And whats about data retention- it is not essential, too?

Emphasizing this data deletion so strong is against long term value, analysis problems, auditing, maybe AI model training, improving products and more?

In finance and Healthcare data must be retained for a defined period to comply with regulations. Delete the Blockchain and there will be no user experience any more at all. How this is managed?

The EU, we shall not stand in the way of the smart innovative people of us with this kind of strict regulatory bs, i am sorry, but we need less regulation. More innovation. Chance this deletion policies. People will flee into other markets because eu behavior is against its own interests.
