The system of blockchain would require to be firstly be regulated in relation to the different areas where this system is utilized. For example, the sector of crypto coins mainly uses the blockchain system in order to function; in relation to this sector, thus, the data processed could be more sensitive as all the transactions of the users are processed.

In terms of risk of potential data breach, it is necessary to identify which are exactly the data controllers because it is essential to know who have the responsibility to set a privacy accountable system in terms of organizational and security measures plus the eventual liability for a data breach.

It could be easy, for instance, to identify the data controllers of the apps offering the services on the blockchain system; however, it seems more difficult to identify who are the data controllers of the blockchain system in itself.

Therefore, it will be interesting to see the future evolution on this matter.
